Maps (Graphs on surfaces)

Hypermaps

τ -model for hypermaps

Sergei Chmutov Partial duality of hypermaps

$$au_2 = (1,6)(2,3)(4,5)(7,11)(8,9)(10,12)$$

$$\tau_1 = (1,2)(3,4)(5,6)(7,9)(8,10)(11,12)$$

$$au_0 = (1, 11)(2, 12)(3, 10)(4, 8)(5, 9)(6, 7)$$

τ -model. Example.

σ -model for oriented hypermaps

$$\sigma_F \sigma_E \sigma_V = 1 :$$

σ -model. Example.

$$\sigma_{V} = (1,3,5)(7,8,12) = \tau_{2}\tau_{1}|_{\{1,3,5,7,8,12\}}$$

$$\sigma_{\mathcal{E}} = (1,7)(3,12)(5,8) = \tau_0 \tau_2 |_{_{\{1,3,5,7,8,12\}}}$$

$$\sigma_{F} = (1, 12)(3, 8)(5, 7) = \tau_{1}\tau_{0}|_{\{1, 3, 5, 7, 8, 12\}}$$

Duality for graphs

Partial duality for graphs

$$G^{\{1,2,3,4,5\}} = ???$$

Partial duality for graphs (continuation)

Partial duality for graphs (continuation)

Let S be a subset of the vertex-cells of G.

Choose a different type of cells, say hyperedges.

Step 1. ∂F is the boundary a surface *F* which is the union of the cells from *S* and all hyperedge-cells.

Step 2. Glue in a disk to each connected component of ∂F .

These will be the *hyperedge-cells* for G^S .

Partial duality for hypermaps (continuation)

Step 3. Gluing the vertex-cells.

Partial duality for hypermaps (continuation)

Step 4. Forming the partial dual hypermap G^{S} .

Partial duality. Properties.

(a) The resulting hypermap does not depend on the choice of type at the beginning.

(b)
$$(G^{S})^{S} = G.$$

- (c) There is a bijection between the cells of type S in G and the cells of the same type in G^S . This bijection preserves the valency of cells. The number of cell of other types may change.
- (d) Is $s \notin S$ but has the same type as the cells of S, then $G^{S \cup \{s\}} = (G^S)^{\{s\}}$.
- (e) $(G^S)^{S'} = G^{\Delta(S,S')}$, where $\Delta(S,S') := (S \cup S') \setminus (S \cap S')$ is the symmetric difference of sets.
 - (f) The partial duality preserves orientability of hypermaps.

Theorem. Consider the τ -model for a hypermap G given by the permutations $\tau_0(G) : (v, e, f) \mapsto (v', e, f)$, $\tau_1(G : (v, e, f) \mapsto (v, e', f), \tau_2(G) : (v, e, f) \mapsto (v, e, f')$ of its local flags. Let V' be a subset of its vertices, $\tau_1^{V'}$ be the product of all transpositions in τ_1 for $v \in V'$, and $\tau_2^{V'}$ be the product of all transpositions in τ_2 for $v \in V'$. Then its partial dual $G^{V'}$ is given by the permutations

$$\tau_0(\mathbf{G}^{V'}) = \tau_0, \qquad \tau_1(\mathbf{G}^{V'}) = \tau_1 \tau_1^{V'} \tau_2^{V'}, \qquad \tau_2(\mathbf{G}^{V'}) = \tau_1 \tau_1^{V'} \tau_2^{V'}.$$

In other words the permutations τ_1 and τ_2 swap their transpositions of local flags around the vertices in V'. The similar statement hold for partial duality relative to the subset of hyperedges E' and for a subset of faces F'.

Partial duality in τ -model. Example.

$$\tau_0 = (1, 11)(2, 12)(3, 10)(4, 8)(5, 9)(6, 7)$$

$$\tau_1 = (1,2)(3,4)(5,6)(7,9)(8, 10)(11, 12)$$

$$\tau_2 = (1,6)(2,3)(4,5)(7, 11)(8,9)(10, 12)$$

 $\tau_0 = (1,11)(2,12)(3,10)(4,8)(5,9)(6,7)$

 $au_2 = \boxed{(1,2)(3,4)(5,6)}(7,11)(8,9)(10,12)$

Theorem. Let S be a subsets S := V' of vertices (resp. subset of hyperedges S := E' and subset of faces S := F') of a hypermap G. Then its partial dual is given by the permutations

$$\begin{aligned} \mathbf{G}^{V'} &= (\sigma_{\overline{V'}} \sigma_{V'}^{-1}, \sigma_E \sigma_{V'}, \sigma_{V'} \sigma_F) \\ \mathbf{G}^{E'} &= (\sigma_{E'} \sigma_V, \sigma_{\overline{E'}} \sigma_{E'}^{-1}, \sigma_F \sigma_{E'}) \\ \mathbf{G}^{F'} &= (\sigma_V \sigma_{F'}, \sigma_{F'} \sigma_E, \sigma_{\overline{F'}} \sigma_{F'}^{-1}), \end{aligned}$$

where $\sigma_{V'}$, $\sigma_{E'}$, $\sigma_{F'}$ denote the permutations consisting of cycles corresponding to the elements of V', E', F' respectively, and overline means the complementary set of cycles.

Partial duality in σ -model. Example.

 $\sigma_V = (1, 3, 5)(7, 8, 12)$

$$\sigma_E = (1,7)(3,12)(5,8)$$

$$\sigma_F = (1, 12)(3, 8)(5, 7)$$

$$\begin{aligned} \sigma_V(G^{\{\nu\}}) &= \sigma_{\overline{V'}} \sigma_{V'}^{-1} = (1,5,3)(7,8,12) \\ \sigma_E(G^{\{\nu\}}) &= \sigma_E \sigma_{V'} = (1,12,3,8,5,7) \\ \sigma_F(G^{\{\nu\}}) &= \sigma_{V'} \sigma_F = (1,12,3,8,5,7) \end{aligned}$$
